

Market Update Healthcare IT & Consulting

- 1 Market Overview
- 2 Sector Snapshot
- 3 Public Markets
- 4 Notable Deals

M&A activity within the broader Healthcare IT & Consulting ecosystem during Q1 2023 took a slight decrease in terms of deals quarter-over-quarter (QoQ) (-7.8%), lower than the decrease of the entire IT Services M&A market (-13.5%). In terms of capital invested, the market has also seen a decrease in the first quarter of the year of almost 50% QoQ as investors grapple with macroeconomic and interest rate headwinds. Nevertheless, over the last two years, the industry has seen both tremendous growth and M&A activity as the continued adoption of technology for payors, providers, and pharmaceutical firms stays strong. Given the current macroeconomic concerns investors have displayed some conservatism, but remain willing, eager, and able to compete for strong assets that help to complete strategic goals as organic growth slows.

Digital health technologies are forecasted to continue strong growth given the continued momentum driven by the adoption of new applications and solutions to streamline legacy systems and optimize total IT spending. Many technologies will likely focus on expanding access to care via an integrated experience and on generating data that can improve patient and population health. These advancements could lead to the development of digital health ecosystems that create much-needed connections between various stakeholders and meaningful health data. In addition, AI will probably have an increase in testing and drug development and tools that enable personalized care.

Healthcare IT & Consulting Services Deal Count and Capital Invested

7MA has completed numerous M&A transactions for companies operating in the Healthcare IT & Consulting Industry and has developed unparalleled deal expertise and knowledge of the industry trends, valuation trends, and most active strategic and financial buyers. Please contact Andy Johnston or Ben Garber if you would like to learn more about 7MA’s Healthcare IT & Consulting practice.

Artificial Intelligence in Healthcare

Market Overview

AI and ML can be used to analyze patient data, detect patterns, and improve clinical decision-making. They can also be used to personalize treatment plans and improve patient outcomes. For example, the company Caption Health—which is in the process of being acquired by GE Healthcare—developed a clinical application that uses AI to assist in conducting ultrasound scans to identify signs of heart failure. This technology can be used by non-specialists, making it more accessible and affordable for patients.

The use of Artificial Intelligence, specifically machine learning tools, will cross over \$20 billion in 2023. Not just ML (Machine Learning), various AI (Artificial Intelligence) technologies such as Natural language processing, computer vision, pattern recognition algorithms, and predictive analysis which are already functioning, will continue to be embraced all throughout 2023 as their usability and value continue to permeate all aspects of the Healthcare and Life Sciences ecosystem. Once AI is adopted, there is no looking back as the benefits will continue to produce ROIs that justify the cost of these technologies.

Types of AI Reshaping Healthcare

Machine Learning

Statistical technique for fitting models to data and to 'learn' by training models with data. The most common application of traditional machine learning is precision medicine – predicting what treatment protocols are likely to succeed on a patient based on various patient attributes and the treatment context. The great majority of machine learning and precision medicine applications require a training dataset for which the outcome variable is known.

Natural language processing

This field includes applications such as speech recognition, text analysis, translation and other goals related to language. In healthcare, the dominant applications of NLP involve the creation, understanding and classification of clinical documentation and published research. NLP systems can analyze unstructured clinical notes on patients, prepare reports (e.g. on radiology examinations), transcribe patient interactions and conduct conversational AI.

Physical robots

Robots can perform pre-defined tasks like lifting, repositioning, welding or assembling objects in places like factories and warehouses, and delivering supplies in hospitals. Surgical robots, initially approved in the USA in 2000, provide 'superpowers' to surgeons, improving their ability to see, create precise and minimally invasive incisions, stitch wounds and so forth.

Robotic process automation

This technology performs structured digital tasks for administrative purposes, i.e. those involving information systems, as if they were a human user following a script or rules. In healthcare, they are used for repetitive tasks like prior authorization, updating patient records or billing. When combined with other technologies like image recognition, they can be used to extract data from, for example, faxed images in order to input it into transactional systems.
